

Review ordered by revenue impact. Everything below is quoted verbatim from your live docs.

CRITICAL — silent no-fill risks (fix before any new publisher onboards):

1. **React Native LevelPlay has a different Network Key than every other platform.** RN shows Network Key `15c11cbd1`. Android, iOS, and Flutter all show `15c101ba1`. One of these is wrong, and a wrong network key is a silent no-fill with no error surfaced. I can't tell which is canonical — verify against the LevelPlay dashboard / Tuvoc and correct the outlier. This is the "transposed RN LevelPlay key" from your earlier audit, still live.
2. **placementName case-sensitivity is still undocumented.** Every page passes `{"placementName": ...}` but no page warns it's case-sensitive. This was flagged as the root cause of the live Flutter-GAM bug — still not addressed anywhere in the corpus.
3. **Flutter GAM page installs the AdMob package.** The GAM Flutter guide lists `tap_mind_ads_admob: ^0.0.11` in both Android and iOS blocks — that's the AdMob package on the GAM page. A publisher following it literally integrates the wrong adapter. Copy-paste leak.
4. **minSdkVersion is inconsistent and likely wrong on the GMA/Next-Gen pages.** GMA and Next-Gen pages say `minSdkVersion 23`; Flutter/RN say `24`; Cocos says `26`; Orchestration says API `24`. All of them depend on `play-services-ads:25.0.0`. You may want to verify, but per your own established decision, GMA SDK 25.x enforces minSdk 24 — which means the `23` pages will fail the manifest merge for a publisher who sets 23, and the Cocos `26` is stricter than needed with no stated reason. Align the whole fleet to 24 unless there's a Cocos-specific reason for 26.

HIGH — wrong-platform content bleeding across pages:

5. **React Native pages carry Flutter content.** The RN iOS Podfile block is Flutter's (`target 'Runner', flutter_install_all_ios_pods`), and the RN AdMob/AppLovin/IronSource pages say "when you initialize the plugin in your **Dart code**." RN is JS/TS, not Dart, and doesn't use a `Runner` target. This is the "RN contains Flutter content" audit item, still live across all four RN mediation pages.
6. **Flutter package naming is internally inconsistent.** AdMob is `tap_mind_ads_admob` (underscored "tap_mind"), while AppLovin/IronSource are `tapmind_ads_applovin` / `tapmind_ads_ironsource`. On pub.dev these are different package identities — confirm the published names and make them consistent.

MEDIUM — versioning / trust signals (matches your open items):

7. **Flutter is still on 0.0.x** (`0.0.11` / `0.0.9` / `0.0.8`) — the publisher-trust-signal gap you already flagged; a path to 1.0.0 is still needed.
8. **Unity and Cocos install from Git HEAD with no version pin** — Unity via `...TapMind-CA-Admob-Unity.git` (no tag), Cocos via

`archive/refs/heads/main.zip` (main branch). Both expose HEAD, as flagged. iOS pods are also unpinned (`pod 'TapMindAdapter'`, no version).

9. **iOS LevelPlay SPM repo looks wrong for a native-iOS page:** it points to `TapMind-CA-Unity-Levelplay-iOS.git` — a Unity-named repo on the native iOS guide. Verify that's intended.

MEDIUM — test-mode pattern misalignment:

10. Orchestration does it correctly (`testMode(BuildConfig.DEBUG)`, build-type-driven). But the GMA LevelPlay pages rely on a documentation warning ("crucial to disable test mode before going live... financial loss") — the exact doc-warning approach your PRD principle rejects. It's also inconsistent: only LevelPlay mentions test mode; AdMob/AppLovin/GAM GMA pages don't mention it at all.

LOW — cosmetic but sloppy (undermines publisher confidence):

11. "IRONSOUCE-LEVELPLAY" (missing R) is repeated on every LevelPlay page.
12. Dependency comments are miscopied: AppLovin/IronSource blocks say `// Add TapMind SDK AdMob Adapter dependency`, and `// Add AdMob SDK dependency` sits above `play-services-ads` on non-AdMob pages.
13. The GMA AdMob **Android** page omits the `<meta-data>` AdMob App ID manifest step — yet the AppLovin and IronSource pages include it. AdMob is the one where a missing App ID hard-crashes on launch, so it's the worst page to omit it from.

Still entirely absent from the corpus (confirmed, not just missed): a **ProGuard/consumer-rules page** and a **troubleshooting section**. Both were in your earlier audit; neither exists in the 33 pages.

Cross-document impact you should note: your planned GAM v3 rename to `com.tapmind.tech.v3.TapMindMediationAdapterGAM` will introduce a *third* GAM class namespace — docs currently ship `com.tapmind.tech.TapMindMediationAdapterGAM` (GMA) and `com.tapmind.mediation.ng.TapMindGamAdapter` (Next-Gen). When v3 ships, all GAM pages plus the class-string reference page need a coordinated update, or you'll have three namespaces live simultaneously with no page telling a publisher which applies to their SDK product.

What you're not thinking about: the biggest structural risk here isn't any single typo — it's that these pages are clearly maintained by copy-paste across 33 near-duplicate pages, so every fix has to be applied 4–6 times and drift reappears on the next edit. The network-key mismatch, the Flutter-content-in-RN, and the miscopied comments are all symptoms of the same thing. The durable fix is to move the truly variable values (network key, class string, package name, minSdk, version) into JAMdesk **snippets** (you already use `/snippets/doc-tag-*.mdx`) so each value has one source of truth and can't drift per-page. That's a bigger change than patching text, but it's the difference between fixing this once versus re-auditing it every release.
